Developmental Biology of the Sea Urchin Embryo

By GIOVANNI GIUDICE

*Istituto di Anatomia Comparata
Universita di Palermo
Palermo, Italy*

This volume represents the first comprehensive review since 1956 of sea urchin development. It brings together in a single source significant research data from a number of studies of the sea urchin embryo — information previously scattered throughout the literature. It deals with morphological, embryological, metabolic, and molecular aspects of sea urchin development, and demonstrates techniques not only for dealing with specific experimental problems but also for evaluating existing experimental data. Extensive references direct the reader to the large body of literature that has accumulated concerning this organism.

CONTENTS:

PART I: MORPHOGENESIS AND RELATED PROBLEMS

Experimental Embryology of the Sea Urchin

Conformational Properties of Macromolecules

By A. J. HOPFINGER

*Division of Macromolecular Science
Case Western Reserve University
Cleveland, Ohio*

A Volume in the MOLECULAR BIOLOGY Series

This book provides a comprehensive discussion of the theory of conformational energy calculations and the application of this theory to the prediction of macromolecular properties. Special emphasis is given to the justification of the use of empirical potential functions in molecular structure calculations.

Major topics covered include the following:

- Macromolecular geometry and classic problems in chain statistics — emphasis is on the application of linear algebra to the description of macromolecular geometry
- In-depth discussions of the forces that dictate molecular conformation and illustrations of new and novel approaches to treating polymer-solvent interactions
- The accuracy of conformational energy calculations and comparisons of many experimental and theoretical findings
- Conformational transitions — where and how conformational energy calculations might be used to describe the thermodynamics of such transitions
- The combining of conformational energy calculations with ORD/CD and NMR spectroscopies to study macromolecular structure

This book will be of interest to students and workers in chemistry, biochemistry, biophysics, polymer science, materials science, and physics.

CONTENTS:

Macromolecular Geometry, Conformational Energies and Potential Functions, Accuracy and Refinement of the Potential Functions, Conformational Transitions in Macromolecules, Applications of Conformational Potential Energy Calculations, Appendix I: Empirical Nonbonded Potential Functions between Ions and Atoms in Molecules, Appendix II: Detailed Balancing Approach to Equilibrium Properties of Linear Chains.
